

Business Problems - Walmart PYTHON + SQL Project

1. What is the total revenue generated overall?
2. Which category generates the highest revenue and which the lowest?
3. Which city/branch contributes the most/less to total sales?
4. What is the average transaction value (basket size)?
5. What is the month-over-month or day-over-day sales trend?
6. Find different payment methods and number of transactions, number of quantity sold.
7. Identify the highest rated category in each branch, displaying the branch, category, and average rating.
8. Identify the busiest day for each branch based on the number of transactions.
9. Calculate the total quantity of items sold per payment method. List payment_method and total_quantity.
10. Determine the average, minimum, and maximum rating of category for each city.
11. Calculate the total profit for each category by considering $\text{total_profit} = \text{unit_price} * \text{quantity} * \text{profit_margin}$. List category and total_profit ordered from highest to lowest profit.
12. Determine the most common payment method for each branch. Display branch and preferred_payment_method.
13. Categorize sales into 3 groups: MORNING, AFTERNOON, EVENING. Find each shift and number of sales.
14. Identify the 5 branches with the highest decrease ratio in revenue compared to last year (2023 vs 2022).
